## Control Panel Design & Build

We provide control panel solutions that are built to last and meet a wide range of applications across a broad range of industries, from the hostile and often extreme environments in the Steel, Paper, Chemical and Oil sectors to the technology led environments in the commercial sectors.

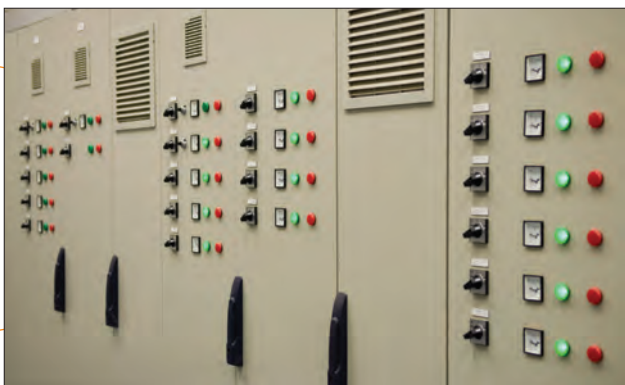

We have the facilities to build and test a wide range of control panels, ranging in size from instrument enclosures to 'walk in style cubicles'.

Control panels can be designed and custom built using standard off the shelf enclosures (i.e. Rittal, Legrand, Sarel etc.) or custom built to your required standard, drawings and specification.

We can install your control panel (including any associated equipment) and commission to your required design brief.

We can design and procure "certified" control panels for "hazardous area" applications.

All our control panels are built using quality components that are engineered to last. Our work is then tested and inspected before it leaves our premises and is quality assured to BS EN ISO9001.

*"Building quality solutions  
for our clients."*
