

Technical Data

STAUFF high pressure filters are designed for in-line hydraulic applications, with a maximum operating pressure of 420 bar. Used together with STAUFF filter elements, a high efficiency of contaminant removal is assured. The high dirt holding capacity of the elements ensures long service life and, as a result, reduced maintenance.

Technical Specification

has been reached

Construction	In-line assembly, with threaded mounting holes on top of head	Reverse flow valve	Allows reverse flow through the filter head without backflushing			
Filter head	Spheroidal graphite cast iron		the element			
Filter bowl	Cold drawn steel	Non-return valve	Prevents draining of the delivery line during element change			
Seals	O-Rings NBR (Buna-N), FPM (Viton), EPDM (Ethylene-propylene), Support ring PTFE	Multi-function valve	Forward bypass, reverse flow capability, and non return valve (opening pressure $6^{+0.5}$ bar Δp) all in one valve			
Port connection	BSP, NPT, SAE "O"-Ring thread, or SAE Code 62 flange	Clogging indicators	Visual, 5-0.5 bar Δp actuating pressure			
Operating press. max.	420 bar		Visual/electric, $5_{.0.5}$ bar Δp			
Proof pressure	630 bar		(24 V, 110 V, 220 V versions)			
Burst pressure	>1260 bar	Filter elements	Specification see page 8.			
Temperature range	-10°C up to +100°C	Media	Mineral oils; other fluids on request			
Bypass valve	Allows unfiltered oil to bypass the contaminated element once the opening pressure					

Valves

The optional valves are fitted as an insert in the filter head and incorporate the spigot on which the element seals. The valve is selected to suit the filter application.

- HV O Non-bypass standard insert without any valve function. Element collapse rating should be higher than system pressure.
- **HV B** Bypass valve which allows oil to bypass the element when the differential pressure across the element reaches $6^{+0.5}$ bar. (Other pressure settings available on request). The opening pressure should be higher than the Δp setting of an optional clogging indicator. Low collapse (30 bar Δp) elements are normally used with this valve.
- **HV R** Reverse flow valve is used in systems where there is flow in reverse through the filter. It allows reverse flow without backflushing the element but does not filter in the reverse direction. High collapse elements (210 bar Δp) are normally used with this valve.

HV - N Non-return valve

This valve prevents the oil in the delivery line from draining out while the filter is being serviced. Because there is no by-pass, the element collapse rating should be higher than system pressure.

HV - MMulti-function valve
This valve combines the by-pass,
the reverse flow, and the non-return
functions in one unit. The by-pass
opening pressure is $6^{+0.5}$ bar Δp with
other opening pressures available on
request. The opening pressure should
be higher than the Δp setting of an
optional clogging indicator.

N Non Return Valve			-			045/070					
M Multi-Function Valve						090/160					

Flow characteristics of the valves see page 19

Clogging Indicators

STAUFF pressure filters have a range of clogging indicators available as an option. If no indicator is specified, the port is sealed by a plug (HI-O). The clogging indicators are actuated by the differential pressure (Δ p) across the element and the special piston design minimises the effects of peak pressures in the system. An optional thermostatic lockout (thermostop) is available to prevent false indication under cold start conditions. Fluid temperature must be at least 20°C for the indicator to function.

Direct Current: see table below

Voltage V	Resistive Load Amps	Inductive Load Amps
24 110 220	8,00 0,50 0,25	7,00 0,20 0,10

N. B. High voltage peaks occur when inductive loads are switched off. Protective circuitry should be employed to reduce contact burnout.
