

# Westward go!

Rosler UK based in Knowsley Merseyside, celebrates Moleroda's growth as agent/distributor covering the South West UK.

As a recent participant in the "Medical Openday" event held on Rosler UK premises last July, the outstanding success spurred an excellent opportunity to further build on the already strong link.

Moleroda Finishing Systems, based in Whaddon, Salisbury, Wiltshire, has been manufacturing and supplying precision engineers for over 30 years. The company was expanded by purchasing the manufacturing company "Hutchinson" a company making felt products, polishing compounds and mops for the Jewellery industry. Moleroda then continued making felts and added polishing products for engineering industries especially for the mould toolmakers. Moleroda paste is still a unique compound used for lapping components together for the aerospace industry and for polishing high quality mould tools.

Today, the company also manufactures polishing and specialist deburring tools to many industries including; aerospace, oil and gas, automotive, medical, and the fast growing prototyping sector to name just a few and are now gaining recognition abroad, with exports accounting for about 30% of factory output, to over 12 countries.

The link with Rosler comes into its own where a customer has any sort of volume production where external finishing is required including deburring, degreasing, aesthetic blending of machine marks and/or polishing through to super finishing.

Moleroda's ability to handle the intricate lower volume and Rosler's high volume solutions means the company is well placed to assist a wide range of manufacturing companies with their finishing needs.

Owner William Dunkerley and the team have been joined in the last few years by his daughter, Lizzie who has become involved with sales and e-commerce website development. Lizzie spends much of her time visiting customers and helping to solve tricky deburring and polishing issues which often results in the manufacture of bespoke mounted tools for their customers as no two applications are the same. They are in a good position where they can offer specialist deburring tools and are always inventing new products and driving the market forwards.

Moleroda Finishing Systems long standing relationship with Rosler goes back twenty five years ago and the two companies are in the process of setting up a specialist deburring and polishing demonstration area in the new Whaddon factory, just outside Salisbury. This will include new lower cost Rosler ECO machines, micro blasting, Eneska 4-1 hand systems, flexible drive polishing and deburring systems and specialist deburring stations. As well as representing Rosler in the South West as it has done previously Moleroda's territory will now also each into South Wales to offer customers the best possible service.

So for the first time companies in the South West Moleroda offer a one stop shop for all surface preparation, deburring and polishing enquiries and will be able to bring projects & components to their premises to assess and supported by the Rosler Group.
