

Overview

Our experience, gained over 50 years, is available to help you obtain exactly what you need to meet your requirements. We are committed to providing you with outstanding service at all times, backed by our registration to ISO 9001.

To meet your precise needs we can adapt our products using our range of optional modifications (see the 'Storage and Transport Vessels' product sheet, pp 7–8) or by customising to order. However, if you want something completely different, we would be pleased to quote for it.

Introduction to stainless steel

Stainless steel is a durable, versatile and hygienic material that is resistant to corrosion and looks good!

Technically, "stainless steel" is the name given to steels containing a minimum of 11% chromium. In practice, most stainless steels contain 18% chromium to improve

corrosion resistance. Most stainless steels also contain nickel, to increase corrosion resistance still further.

There are over 200 different types of stainless steel, each with a different range of properties. However, five types account for the bulk of usage, and Adelphi products are generally made from two of these types, known as 304 and 316L grade.

304 is an excellent general grade of stainless steel. 316L contains molybdenum and has a low carbon content (less then 0.03%), and has even better corrosion resistance than 304 grade. 316L is preferred in many instances, particularly in pharmaceutical, cosmetic, food and dairy applications.

Stainless steel has outstanding resistance to corrosion and attack from a very wide range of chemicals and products. However, there are some situations where it is not suitable. Corrosion resistance depends on the temperature and concentration as well as the chemical composition of the product in contact with the stainless steel.

Stainless steel corrosion chart

Corrosion resistance depends on the temperature and composition as well as the chemical composition of the product in contact with the stainless steel. The information in the chart below is given only as a general guide and is

not a warranty of performance or corrosion resistance of any product in this brochure, or elsewhere. Adelphi accepts no liability for the performance of products in individual applications chosen on the basis of the information provided here.

Key

- **OK** Can be considered corrosion proof
- C Depends on concentration of solution
- M Risk of pitting corrosion in presence of moisture
- P Risk of pitting corrosion
- Use 316L grade if sulphure dioxide is used S as a preservative
