

New Product Information

Release: HAPR0106

Release date: immediate

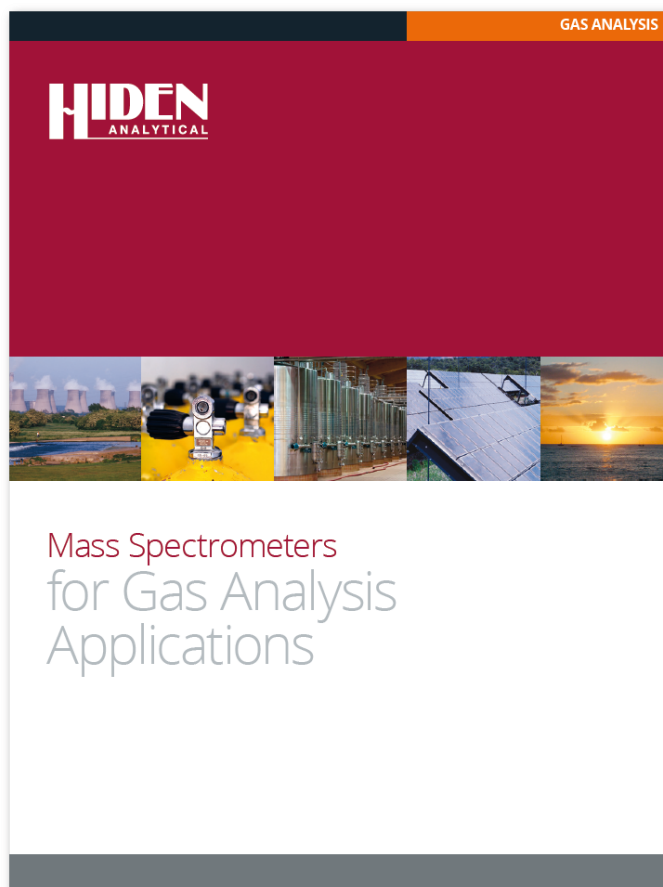

Hidden Release New Gas Analysis Catalogue

With over 30 years experience in the field, Hiden Analytical continues to remain dedicated to producing mass spectrometer-based gas analysis systems. The latest product catalogue, just released, highlights the full range of application-specific standard systems for analysis of gases and vapours in diverse environments, addressing measurement of samples at pressure from millibar to 30 atmospheres and with sample quantities down to less than 0.1scc. The product range evolved from the companies ability and willingness to support their users by custom-engineering dedicated and specialised interfaces for integration of the mass spectrometer with diverse processes, and this continues to be a significant element of the company's activity.

The QIC series provides the general-purpose laboratory work-horses for continuous analyses where sample size is not a specific limitation, with sample consumption rates down to 1scc/min. The HPR series are biased towards the researcher and to the more specialised applications such as evolved gas, gas reaction and fast event studies, small sample analysis with aliquot sizes to 0.1scc, measurement of flame and atmospheric plasma composition, top-gas and dissolved gas monitoring from and in aqueous solution.

The catalogue is available to **download** at:
