

Building ADDITIONS 100 Series Electroglide

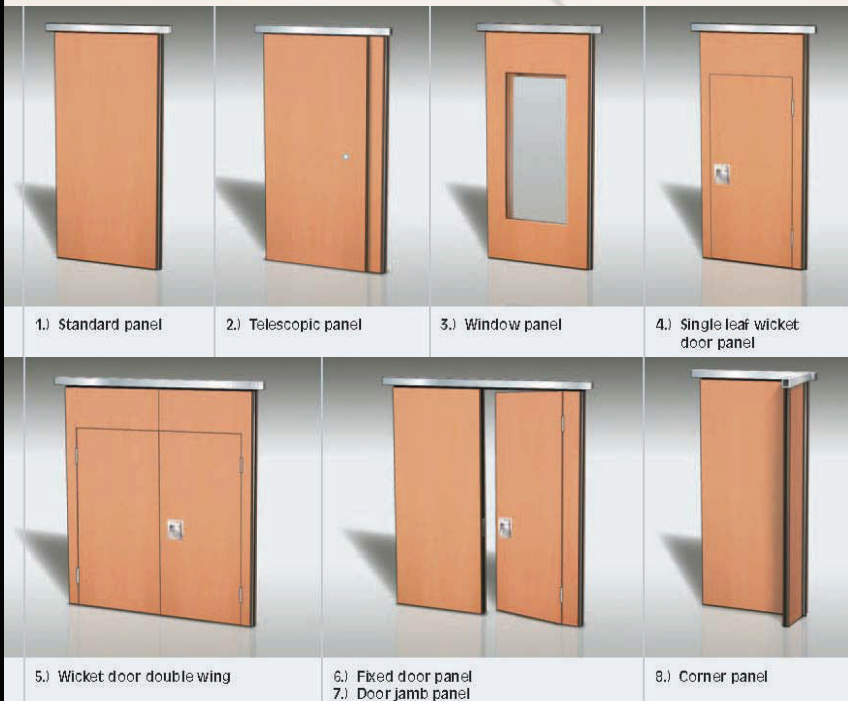

The Electroglide partition has microprocessor controlled electrical motors inside each panel to operate the top and bottom seals as the panels are pushed together. It is a simple plug-in system which is connected to mains electricity via a normal plug and switched socket. Operation is by way of the standard key provided.

As the panels are positioned together and electrical connection is made and the seals operate. The internal microprocessor ensures that a seal pressure of 2000N is achieved uniformly across the opening. The motors were painstakingly designed and developed in conjunction with BMW and have been tested vigorously to the exacting standards that BMW are noted for.

We can install Electroglide as an option on the following 100 Series panel types
