

Case Study

Project: Training Centre
Product/system: Tor Coatings Elastaseal 15 Year System
Size/value: 1,100m²

Problem

Lancashire Police had severe water ingress from the failure of the old bitumen felt roof covering. The building had to remain in constant use throughout the project, therefore hot works and noise disruption from stripping the old felt system was not acceptable to the client.

Solution

In order to maintain full functionality of the training centre during the re-roofing works. Gables offered a cold applied, breathable membrane that was able to be applied directly to the existing felt, eliminating the risks and disruption associated with hot works and stripping coverings.

All moss algae and stone chippings were removed from the deck. Any previous failed repairs were removed and made water tight. The roof was power washed to remove all surface contaminants before applying the Tor Coatings Elastaseal system, consisting of a fully reinforced base coat and a liquid applied top coat giving a 15 year single point guaranteed system.

All works were completed on time and on budget and the pictures above clearly show the quality of finish and condition of site after handover.
