

Combination Tanks

Priden engineering offers a complete range of aluminium / stainless steel combination tanks to suit all manufacturers of chassis. All tanks are built in accordance to EU regulations and can either be supplied or fitted at our premises.

Due to the limited useable space available on modern tractor units, combination tanks offer a dual solution to customers' operational requirements. Tanks available can either be a combination of fuel / hydraulic oil / ad-blue tank or if additional storage space is required then a combination fuel and toolbox solution can be achieved.

Tanks are built to order and are usually available one week from date of order. All tanks are built to customers specific requirements with further services offering repair or conversions to existing factory tank.

Please contact one of our experienced sales team with your enquiry or check out our gallery to see examples of conversions that have been undertaken.
