

In tests, a CABLEFLOW Cable Driven Tubular Drag Conveyor handles Roasted Coffee Beans without any discernible damage

### Customer

A famous US coffee producer already has several Tubular Drag Conveyors at his factory but was looking for an alternative supplier.

### Key requirements

The conveyor needed to handle the customer's product without damage.

### Products handled

Roast and Dark Roast Coffee Beans

### Spiroflow solutions

For numerous years we have designed and manufactured a comprehensive *range* of Aero-Mechanical Conveyors, many of which have been operated at speeds less than required to entrain product in the vacuum created by the high speed of the cable driven discs.

At lower speed, they are operating in 'drag conveyor' mode. In this mode, the conveyor pushes material, rather than pulling it, along the conveying tube. In so doing, it uses less energy and is more gentle on certain products.

To prove our conveying capabilities and to demonstrate that one of our CABLEFLOW Cable Driven Tubular Cable Drag Conveyors is well suited for this application, we set up a test. This was witnessed by the customer.

### Customer benefits

- The tests were a complete success.
- The customer now has an alternative supplier.
