

Repetitive procedures in cemeteries and crematoria- lowering the cost, making the inspector more productive!

With continuing pressure on budgets, one of the most significant contributions we can make to reducing costs in cemeteries and crematoria is in the maintenance and safety inspection field, which is both laborious, repetitive, and obligatory. To prove duty of care these procedures can include walk arounds, tree inspections and maintenance, emergency exit door checks, cleaning, vehicle maintenance, alarm system tests, outdoor furniture inspections, damage recording and repair actions. As long as the object to be inspected is microchipped or barcoded, a mobile device can be employed to record a visit, display inspection records, and edit the status completely removing the need for paper files, and making the workforce more productive. The Wi-Fi or 3G linked Cloud based software program is always on, viewed from anywhere even on smart phones, and keeps an audit trail of who did what when. No USB cables are involved at all. Demonstrations can be made by webinar at any time. Here's a screen shot displaying how one client converted all their paper based recording and spreadsheets to multiple databases held in our online tracking system
