AQUATEST

Aquatest has been developed by Vapor-Tek as an additive to render water non-corrosive. It is available in the form of a concentrate and is normally used at a level of 2-5% depending on the application and water quality (hardness, brackishness, impurities, etc.).

However, concentrations as low as 0.2-0.5% can be used to prevent the flash rusting of steel in a power wash, e.g. steel drum reconditioning.

Aquatest is non-flammable, contains no solvents or VOCs and is pH near neutral.

Used at the recommended concentrations it can be discharged to sewers when not recycled.

Aquatest prevents the corrosion of iron, steel and other ferrous alloys. Also, it is safe for use in the presence of most non-ferrous metals such as aluminium, copper, brasses, bronzes, zinc, tin-plate, etc.

It contains no nitrites or other toxic chemicals.

Typical uses include:

Hydrostatic pressure and leak testing of:

Tanks

Pipework

Heating and cooling systems

Pressure vessels

Pumps, valves, joints

Fire extinguishers

Heat exchangers

Gas cylinders

Radiators

Boilers
