The Rejuvenation Process:

Step 1:
Extract the infill using a SSP rejuvenation unit.

Step 2:
Collecting and removing the contaminated infill.

Step 3:
The contaminated infill is removed.

Step 4:
Application of new sand infill.

The rejuvenation of an astro turf pitch can restore it to a virtually 'as new' condition, extending its useful life. The rejuvenation process removes the conditions of infill compaction and contamination as well as synthetic grass fold, which leads to problems such as hardening of the surface, flooding, moss and algal growth, as well as slime growth.
