

# Tobacco Track and Trace Solution

Since May 2019, all tobacco products manufactured and supplied in the UK are subject to the new European Tobacco Product Directive (EUTPD). Unique Identifier (UID) codes will be applied to shipping cases, cartons and packs of cigarettes so that their movements can be tracked throughout the supply chain.

Any company involved in the supply and distribution of these products with UID codes are required to record and submit this information via the EUPTD Track and Trace System. However, any products manufactured or imported before this date will not be enforced until 20 May 2020.

## Our solution

We are committed to helping businesses comply with the EUTPD and have developed a solution within our *Accord* WMS system. It will minimise the impact of these new rules on your operations and ensure you maintain efficiency across your supply chain.

## How it works

- **All the necessary fields are included** so you can record and submit the information required by EUTPD.
- **It integrates with the EUTPD Track and Trace System** so you can easily submit information about when products arrive, when they are dispatched, who they were dispatched to, vehicle allocation and payment/invoice details.
- **You will receive confirmations back** from the EU at each stage.
- **There is a control panel** with visual representation of the submission status.
- **Supervisors will be informed of submission errors or failures** so delays can be avoided.

## Benefits to you

- **It eliminates the need for multiple scanning** because the EUTPD compliance is integrated within the existing warehouse management process.
- **Manual data entry is reduced** because you can register all relevant customers on mass by sending a customer file to the ID issuer.
- Various picking methods are supported so **you don't have to change your warehouse processes.**
- **It automates the payment and invoice transmissions** to save you time.
