

SF70 Sliding Folding Doors — Wilmslow , Cheshire

In this particular case our products were specified by the architect involved with the design. The client was having a new kitchen extension which included a family area. The owner who is a keen cook wanted to incorporate the family area and at the same time enjoy the garden area especially in the summer months.

The SF70 thermally broken aluminium doors were specified because the system allows us to use the 90° movable corner post which means that the whole corner can be opened up. The installation also incorporates two triangular windows in the end of the gable to flood the family area and the kitchen with natural light. We were able to ensure that there is a minimal step into the garden by sinking the track and sub cill while retaining a proper weathered track. There is also a two door set at the side to give yet more opening options. We supplied and installed the cladding for the steel work using polyester powder coated aluminium components. The colour chosen by the client is RAL7044 which matched the kitchen design exactly.

We have since carried out a number of other installations working closely with the architect and the builder.
