

Push pad – emergency access hardware.

Fire exits are easily achieved in the 'Metalmesh' partitions by a specially modified door and exit hardware. This must be specified before manufacture and although the 'extra over' price structure suggests retro fitting is possible. This kit must be added to the door before despatch to site. Access into the cages is achieved by 'Yale' key. These are not recommended for high security, although often used for 'during the day' use. Night security is often achieved by the addition of padlock hasp.

Euro/Oval locks.

The full range of mortice locks with Eurocylinder or Ovals, including combination and keycard access are available. Suited systems with Master keys are available as are high security cylinders for high value goods.
